

Figure 1: PRISMA 2020 flow diagram

PRISMA 2020 two-arm flow. The database arm ran a boolean search of OpenAlex and a title search of dblp on 2026-07-13, identifying 400 records, of which 5 were duplicates, leaving 395 screened on title and abstract, 355 excluded against the recorded criteria, and 40 included. The dominant exclusion was E2 (subject is not a security-telemetry data architecture, n = 137), followed by E1 (a machine-learning classifier evaluated on a streaming platform, where the platform is plumbing rather than the object of study, n = 103). The other-methods arm is the curated corpus of vendor engineering blogs, practitioner talks, standards documents, and technical books that a bibliographic database cannot return, since it is not journal or conference literature. The 40 database-included studies then passed through a critical-appraisal stage that the topical screening had not applied, and 14 did not survive it: eight sat in predatory or compromised venues, three were not peer reviewed, one could not be read, and two were refused by the independent LLM verification pass. An independent second screen of all 355 exclusions (2026-07-16) led to one owner-adjudicated reversal, admitted through the same appraisal gate, so the database arm now contributes 27. The arms do not overlap, and each count above is reproducible from the JSON under methods/prisma-results/ and methods/prisma-appraisal-2026-07-13.json.
